## Abstracts

Renewable energy-powered USVs are autonomous surface vehicles driven by renewable energy sources such as solar and wind energy. They can navigate independently according to pre-set programs or remote instructions without real-time manual control. Relying on advanced energy conversion and storage technologies, they can efficiently convert the obtained renewable energy into power and store it reasonably to ensure continuous and stable operation. They are equipped with various sensing and monitoring functions and can use the installed sensors to collect and analyze real-time information about the surrounding environment, such as temperature, humidity, and water level. In terms of structural design, they have good hydrodynamic performance and stability, can adapt to different water surface environments and complex weather conditions, and ensure the safe and reliable execution of tasks while reducing energy consumption.

The global Renewable Energy-powered USVs market size was estimated at USD 738.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.50% during the forecast period.
