Report Overview

Termiticides have been the cornerstone in termite management. This is largely owing to the cryptic life of termites, the high value of structural property, and the zero tolerance action threshold of termite infestation in residential structures. Termiticides are likely to remain an imperative component in termite integrated pest management (IPM) programmes in the future because newer reduced-risk chemicals have become available. Repellent termiticide have been the treatment option of choice for exterminators for a good number of years. These chemicals do not kill the termites; they simply deter them from entering the treated soil and building tunnels. Repellents make the soil so termite-unfriendly that any approaching termite workers soon stay clear of the treated area.
