## Abstracts

Reprocessing and Recycling of Nuclear Fuel is an industrial process and technological system for spent fuel after reactor use, aiming to achieve a closed-loop cycle of nuclear fuel resources. Reprocessing (chemical separation) is the core process, referring to the separation of valuable materials from spent fuel using chemical methods: approximately 96% reusable uranium and 1% plutonium, separated from approximately 3% high-level radioactive waste. Recycling then uses the separated uranium and plutonium to create new nuclear fuel assemblies and return them to the reactor for reuse, thereby significantly improving the utilization rate of uranium resources and reducing the volume and long-term toxicity of high-level radioactive waste requiring eventual geological disposal. This technology is a key strategic path to achieving sustainable nuclear energy development, reducing the environmental burden of radioactive waste, and enhancing nuclear fuel supply security. Globally, the industrial layout and development strategies for nuclear fuel reprocessing and recycling exhibit significant regional differences. France, Russia, Japan, and the UK are core countries with complete industrial capabilities and practical operational experience, with France's closed fuel cycle system being the most mature and typical. The US has long adopted a "one-time pass" policy, but in recent years has launched research programs and invested in demonstration projects to evaluate technological options. China and India, as emerging nuclear energy powers, both regard reprocessing and recycling as national strategies and are actively building industrial demonstration facilities and developing advanced technologies. While there are differences in technological approaches within the EU, there is overall support for research and development to reduce environmental impact. The global technological development trend is gradually shifting from traditional plutonium and uranium recycling towards exploring advanced fuel cycles aimed at long-lived waste.

The global Reprocessing and Recycling of Nuclear Fuel market size was estimated at USD 641.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
