Report Overview:

An antibody (Ab), also known as an immunoglobulin (Ig), is a large, Y-shaped protein used by the immune system to identify and neutralize foreign objects such as pathogenic bacteria and viruses. The antibody recognizes a unique molecule of the pathogen, called an antigen. Each tip of the 'Y' of an antibody contains a paratope (analogous to a lock) that is specific for one particular epitope (analogous to a key) on an antigen, allowing these two structures to bind together with precision. Using this binding mechanism, an antibody can tag a microbe or an infected cell for attack by other parts of the immune system, or can neutralize it directly.

A reagent is a substance or compound added to a system to cause a chemical reaction, or added to test if a reaction occurs.

The Global Research Antibodies and Reagents Market Size was estimated at USD 256.76 million in 2023 and is projected to reach USD 274.17 million by 2029, exhibiting a CAGR of 1.10% during the forecast period.
