Abstracts

Reserpine is a naturally occurring alkaloid compound found in the roots of certain plant species, such as *Rauwolfia serpentina*. It has been used in traditional medicine for its antihypertensive and sedative properties. Reserpine acts by inhibiting the synthesis and release of norepinephrine and dopamine, leading to a decrease in blood pressure and inducing a calming effect. This compound has been used in the treatment of hypertension, schizophrenia, and certain psychiatric disorders. However, due to its numerous side effects and the availability of more effective alternatives, its use has greatly diminished in modern medicine. According to our research, the global market for medical devices is estimated at US\$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing awareness about early disease diagnosis and treatment.

The global Reserpine market size was estimated at USD 50.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
