Abstracts

Reservoir Modeling Software is a specialized computer tool that integrates geological, geophysical, and reservoir engineering data. It constructs three-dimensional digital models to quantitatively characterize the structure, lithology, physical properties, and fluid distribution characteristics of underground reservoirs. Its core approach is to achieve accurate predictions of reservoir properties from the macroscopic structure to the pore scale by combining deterministic and stochastic modeling, integrating multiple sources of information such as seismic interpretation, well logging data, core analysis, and production performance. This software not only supports geological reserve calculations, development well location optimization, and development plan design, but also enables development performance prediction and remaining oil distribution analysis through coupling with numerical simulators. It is a key technical platform for oilfield exploration and development decision-making, improving oil recovery, and reducing investment risk.

The global Reservoir Modeling Software market size was estimated at USD 89.73 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
