Abstracts

A resettable circuit fuse, also known as a polymeric positive temperature coefficient (PPTC) device, is an overcurrent protection component that automatically interrupts excessive current flow in an electrical circuit and self-resets once the fault condition is removed and the device cools down. Unlike traditional one-time fuses, which require manual replacement after operation, resettable fuses offer reusable protection, reducing maintenance costs and improving system reliability. These devices function based on a sharp increase in electrical resistance when their internal polymer composite heats up due to overcurrent, effectively limiting the current to a safe level. Once the overcurrent event ceases and the device temperature returns to normal, its resistance drops back to a low value, restoring normal circuit operation without user intervention. Key applications span consumer electronics, automotive systems, industrial equipment, telecommunications infrastructure, and renewable energy installations, where they safeguard sensitive components from damage caused by short circuits, inrush currents, or other electrical anomalies.

The global Resettable Circuit Fuse market size was estimated at USD 1320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
