## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Resettable Thermal Fuse competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Resettable thermal fuse is a protective device used in electrical circuits to prevent overheating. It is designed to break the circuit when a specific temperature is exceeded and can automatically reset itself after cooling down, unlike traditional thermal fuses, which permanently break and need replacement once triggered. In 2024 the production was 1.64 billion units and the average price was \$1.1 per unit. Resettable thermal fuses are protection devices that utilize special polymeric or inorganic functional materials to sharply increase resistance and interrupt the circuit when overheating occurs, and to automatically restore conductivity once the temperature decreases. They offer advantages such as fast response, reusability, and cost efficiency. With rising demand for reliable thermal protection in electric vehicles, energy storage systems, consumer electronics, and smart appliances, the market outlook is highly promising. Looking ahead, as products evolve toward miniaturization, higher current-handling capacity, and integration with intelligent monitoring systems, applications in fast charging, automotive battery management systems, and green energy equipment are expected to expand significantly, creating new opportunities for manufacturers to differentiate performance and deliver system-level safety solutions.

The global Resettable Thermal Fuse market size was estimated at USD 1800.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
