Report Overview

Air Source Heat Pump (ASHP) is a device which uses a vapor compression cycle to transfer heat between outdoor air and indoor air or water. There are two type of air source heat pumps including air-to-air heat pumps and air-to-water heat pumps. As the name implies, these systems heat or cool indoor air or move energy into water. An air-source heat pump can provide efficient heating and cooling for your home, especially if you live in a warm climate. When properly installed, an air-source heat pump can deliver one-and-a-half to three times more heat energy to a home than the electrical energy it consumes. This is possible because a heat pump moves heat rather than converting it from a fuel, like in combustion heating systems.

The global Residential Air Source Heat Pumps market size was estimated at USD 10870 million in 2023 and is projected to reach USD 16153.85 million by 2032, exhibiting a CAGR of 4.50% during the forecast period.
