Residual Solvent Analysis (RSA) refers to the analytical process used to detect, identify, and quantify volatile organic compounds that remain in pharmaceutical products, medical devices, cannabis products, and other materials after manufacturing, where these solvents are used during synthesis, extraction, purification, or formulation. The process is governed by stringent regulatory guidelines?most notably the International Council for Harmonisation (ICH) Q3C?which classifies solvents into categories based on toxicity and sets permissible daily exposure limits to ensure product safety and efficacy. RSA employs chromatographic techniques, primarily gas chromatography (GC) coupled with various detectors such as flame ionization (FID) or mass spectrometry (MS), to achieve the sensitivity, specificity, and reproducibility required for compliance with health authority standards across global markets.

The global Residual Solvent Analysis market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
