Report Overview

Resin coated copper foil (RCC) products generally use electrolytic copper foil, the resin is mainly epoxying resin, and a small amount of other high-performance special resins are used, such as BT, PPE, PI, etc. The RCC process is to coat high Tg thermosetting insulating resin on the copper foil, and then roll, strip and cut it after baking. Compared with traditional copper foil substrates, since RCC does not have glass cloth, Varnish can be directly coated on the copper foil, which not only simplifies the complexity of the process, but also greatly reduces the thickness of the electrolytic layer and the weight of the substrate. The thickness of the PCB using the RCC process is half that of the traditional PCB, and the terminal applications are mainly thin and light products such as mobile phones, computers, and cameras.
