Abstracts

Resin Coated Sand (RCS) refers to a specialized foundry material produced by coating high-purity silica sand with a thermosetting resin, typically phenolic or furan-based, which acts as a binding agent when subjected to heat during metal casting processes. This coating enables the sand to form strong, precise molds and cores that withstand high temperatures and pressures while providing excellent dimensional accuracy, surface finish, and collapsibility after casting, making it indispensable in the production of complex metal components across industries such as automotive, aerospace, machinery, and construction. The properties of RCS—including its grain size distribution, refractory qualities, and binder content—are carefully engineered to meet specific casting requirements, ensuring optimal performance in both ferrous and non-ferrous metal applications.

The global Resin Coated Sand (Rcs) market size was estimated at USD 935.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.35% during the forecast period.
