Abstracts

The most important components of electric vehicles (including HEVs and PHEVs) are roughly divided into batteries, power control units (PCUs), and motor/generators. Each of these parts has functions such as control, power storage, drive, and regeneration. These parts are electrically connected with a high-voltage harness with a current between 300V and 600V flowing between them, and a resin material is used for the insulating part of each part. Resin materials contribute to the weight reduction of automobiles while also having insulating properties, so their usage in auto parts is likely to increase as electrification advances. PBT is often used as a resin material because it has constant mechanical properties and chemical resistance in the temperature environment range (-40°C to 140°C) required for automobiles. Global EV sales continued strong. A total of 10.5 million new BEVs and PHEVs were delivered during 2022, an increase of +55 % compared to 2021. China and Europe emerged as the main drivers of strong growth in global EV sales. In 2022, the production and sales of new energy vehicles in China reach 7.0 million and 6.8 million respectively, a year-on-year increase of 96.9% and 93.4%, with a market share of 25.6%. The production and sales of new energy vehicles have ranked first in the world for eight consecutive years. Among them, the sales volume of pure electric vehicles was 5.365 million, a year-on-year increase of 81.6%. In 2022, sales of pure electric vehicles in Europe will increase by 29% year-on-year to 1.58 million.

The global Resin Material PBT for Electric Vehicles market size was estimated at USD 3466.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
