## Abstracts

The resistor aging test system is a system specially used to test the performance changes and life prediction of resistors under long-term use or specific environmental conditions. The resistor aging test system simulates the actual use environment and conditions to conduct long-term performance testing on resistors to evaluate their anti-aging ability and predict their actual service life. The system usually includes components such as a control system, a loading system, a test chamber, and a data acquisition system. It can allow the tested resistor to run for a long time under controlled constant environmental conditions and record its performance changes. The working principle of the resistor aging test system is based on long-term stability testing of resistors under certain temperature, humidity and voltage conditions. By simulating harsh environments such as high temperature, low temperature, and damp heat, observe the performance of resistors under these conditions, such as resistance changes and stability. The test time usually ranges from a few hours to thousands of hours, depending on the use requirements and expected life of the tested resistor.

The global Resistance Aging Test System market size was estimated at USD 3723.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
