Report Overview

An RTD (resistance temperature detector) is a temperature sensor which measures temperature using the principle that the resistance of a metal changes with temperature. In practice, an electrical current is transmitted through a piece of metal (the RTD element or resistor) located in proximity to the area where temperature is to be measured. The resistance value of the RTD element is then measured by an instrument. This resistance value is then correlated to temperature based upon the known resistance characteristics of the RTD element.

The global Resistance Temperature Detectors (Rtd) market size was estimated at USD 1050.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
