Report Overview

Resistive conductive film is a transparent conductive film used in resistive touch screens. It consists of two layers of ITO (indium tin oxide) coating covering a flexible polymer film, separated by an insulating lattice. When the surface is touched, the two ITO coatings can contact each other and connect the circuit at that point. The resistance changes, generating signals in the X and Y directions, and then sending them to the touch screen controller. The advantages of resistive conductive film are low production cost, fast response speed, and suitable for a variety of touch methods (finger, gloves, pen, etc.). The disadvantages of resistive conductive film are low light transmittance, easy to be affected by scratches and stains, short lifespan, and inability to achieve multi-touch.
