## Abstracts

Resorbable adhesion barriers are medical devices designed to prevent or reduce the formation of pathological fibrous adhesions?scar-like tissue bands?that can develop between internal tissues and organs following surgery, trauma, or inflammation. These barriers are typically fabricated from biocompatible, biodegradable polymers?such as hyaluronic acid, cellulose derivatives, polyethylene glycol, or synthetic polyesters?that are applied as films, gels, sprays, or meshes during surgical procedures. They function by physically separating adjacent tissue surfaces during the critical healing phase, thereby minimizing abnormal tissue attachments. Over time, the material is safely absorbed or metabolized by the body, eliminating the need for surgical removal and reducing the risk of long-term foreign body reactions or complications.

The global Resorbable Adhesion Barrier market size was estimated at USD 350.65 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
