Abstracts

Resorbable fixation systems are medical devices used in surgical procedures, particularly in orthopedic, craniomaxillofacial, and dental surgeries, to stabilize and support bone or tissue during the healing process; these systems are designed to be gradually absorbed by the body over time, eliminating the need for a secondary surgery to remove hardware, as is often required with traditional metallic implants. The absorption process occurs through hydrolysis, where the material—commonly composed of polymers such as polylactic acid (PLA), polyglycolic acid (PGA), or their copolymers—breaks down into biocompatible byproducts that are metabolized or excreted, thereby reducing long-term complications like stress shielding, implant migration, or allergic reactions, while promoting natural bone remodeling and healing.

The global Resorbable Fixation Systems market size was estimated at USD 1050.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
