Abstracts

Resorbable interference screws are specialized medical devices used primarily in orthopedic surgeries to secure soft tissue grafts, such as tendons or ligaments, to bone structures. Unlike traditional metal screws, these screws are made from biocompatible materials that gradually degrade and are absorbed by the body over time, eliminating the need for a second surgery to remove the hardware. Common materials used include polylactic acid (PLA), polyglycolic acid (PGA), and their copolymers, which provide the necessary mechanical strength during the initial healing phase and subsequently break down into natural metabolites. The use of resorbable interference screws is particularly prevalent in procedures like anterior cruciate ligament (ACL) reconstruction, where the screw secures the graft within the bone tunnel, facilitating proper integration and healing. The gradual resorption of the screw allows for the restoration of natural bone anatomy and reduces potential complications associated with permanent implants, such as stress shielding or interference with imaging modalities.

The global Resorbable Interference Screw market size was estimated at USD 156.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.60% during the forecast period.
