Abstracts

Resorbable microspheres are biodegradable particles designed for medical and pharmaceutical applications, where temporary functionality and controlled degradation are essential. Made from materials such as polylactic acid (PLA), polyglycolic acid (PGA), or their copolymers, these microspheres are commonly used in drug delivery, tissue engineering, and embolization procedures. In drug delivery, they enable sustained or targeted release of active pharmaceutical ingredients, improving therapeutic outcomes. In embolization, resorbable microspheres temporarily block blood flow to specific tissues, such as tumors, to facilitate localized treatment. Their biocompatibility, customizable degradation rates, and ability to provide precise, localized effects make resorbable microspheres a versatile solution in advanced medical therapies.

The global Resorbable Microspheres market size was estimated at USD 457.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.90% during the forecast period.
