Abstracts

Resource utilization of construction waste involves processing and recycling materials like concrete, asphalt, and wood into new products, such as aggregates for new construction or mulch for landscaping. This requires a multi-step approach, beginning with source segregation and collection, followed by processing techniques like crushing, screening, and sorting to prepare the materials for reuse. Implementing such programs is beneficial for the environment by conserving natural resources and reducing landfill dependency, while also being economically viable, particularly through strategies like implementing circular business models and government incentives. Construction waste resource companies utilize construction waste through reduction, reuse, and recycling, converting it into new products like recycled aggregates or building materials. Their role is crucial for sustainable development by minimizing landfill use and pollution while promoting resource efficiency.

The global Resource Utilization of Construction Waste market size was estimated at USD 759.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
