Abstracts

Respiratory Sleep Monitoring Radar Module is a specialized sensor system designed to monitor breathing patterns and sleep quality using radar technology. It operates by emitting radio waves and analyzing their reflections from a person's chest and abdomen to detect subtle movements associated with respiration. Unlike traditional contact-based methods, such as wearable devices or chest straps, radar-based monitoring is non-invasive, making it more comfortable for long-term sleep studies. These modules are commonly integrated into smart home devices, medical equipment, and sleep analysis systems to provide real-time data on respiratory rate, sleep stages, and potential disturbances like sleep apnea.

The global Respiratory Sleep Monitoring Radar Module market size was estimated at USD 203.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 19.50% during the forecast period.
