Abstracts

Retention and drainage aids are chemical additives used in paper manufacturing to improve process efficiency and product quality by increasing the retention of fine particles and fillers within the paper sheet while simultaneously enhancing water drainage during the forming process. These aids, which include synthetic polymers, natural polymers like starch derivatives, and microparticle systems, function by flocculating suspended solids in the pulp slurry, allowing more fines and fillers to be captured in the paper web instead of being lost to whitewater systems. This leads to reduced raw material consumption, lower wastewater treatment costs, improved paper machine runnability, and better sheet properties such as formation, porosity, and strength. The global market for these additives is driven by the paper industry's ongoing focus on sustainability, cost reduction, and compliance with environmental regulations, with key demand originating from regions with strong paper and packaging production such as Asia-Pacific, North America, and Europe. Growth is further supported by technological advancements in polymer chemistry and increasing adoption of recycled fiber, which requires more efficient retention and drainage control. However, market expansion faces challenges from volatility in raw material prices and the maturity of paper markets in some developed economies.

The global Retention And Drainage Aids market size was estimated at USD 1725.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
