Report Overview

Retimers and redrivers have enabled longer physical channels in servers and storage systems since Peripheral Component Interface Express (PCIe) 3.0 was first introduced almost 10 years ago.

A redriver is a mostly analog reach extension device designed to boost the high-frequency portions of a signal to counteract the frequency-dependent attenuation caused by the interconnect: the central processing unit (CPU) package, system board, connectors and so on.

A retimer is a mixed signal analog/digital device that is protocol-aware and has the ability to fully recover the data, extract the embedded clock and retransmit a fresh copy of the data using a clean clock.

Texas Instrument (TI), NXP Semiconductors, Analogix, Intel, Diodes Incorporated, Parade Technologies, etc. are the leaders of the industry, and top six companies hold key technologies and patents with the most market share over 65%.

Asia-Pacific is the largest consumption area, with a consumption market share nearly 33%. Following Asia-Pacific, North America is the second consumption area.

The application of Retimer (Redriver) includes Servers, Storage Applications and Others, the proportion of Servers is about 43%. Besides, Retimer is the largest product type, it is followed by Redriver.
