### Report Overview:

Retimers and redrivers have enabled longer physical channels in servers and storage systems since Peripheral Component Interface Express (PCIe) 3.0 was first introduced almost 10 years ago.

A redriver is a mostly analog reach extension device designed to boost the high-frequency portions of a signal to counteract the frequency-dependent attenuation caused by the interconnect: the central processing unit (CPU) package, system board, connectors and so on.

A retimer is a mixed signal analog/digital device that is protocol-aware and has the ability to fully recover the data, extract the embedded clock and retransmit a fresh copy of the data using a clean clock.

The Global Retimers and Redrivers Market Size was estimated at USD 163.95 million in 2023 and is projected to reach USD 196.91 million by 2029, exhibiting a CAGR of 3.10% during the forecast period.
