Abstracts

Retractable azimuth thrusters are marine propulsion systems characterized by their ability to rotate 360 degrees around a vertical axis (azimuthing) and to be raised or lowered vertically (retraction) within a vessel's hull or a dedicated thruster room. These systems combine the functions of propulsion, steering, and positioning in a single unit, offering enhanced maneuverability, operational flexibility, and efficiency by allowing the thruster to be deployed only when needed—reducing drag during transit and protecting the unit from damage or fouling in shallow waters or during docking. Typically powered by electric or hydraulic systems, they are integral to dynamic positioning (DP) capabilities and are widely used in offshore support vessels, tugboats, research ships, and other specialized marine applications where precise control and adaptability to varying operational conditions are critical.

The global Retractable Azimuth Thruster market size was estimated at USD 1230.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
