### Report Overview

Retrovirus-based gene therapy drugs are drugs that use retroviruses as vectors to introduce normal or modified genes into patient cells to treat genetic diseases, cancer and other diseases. Retroviruses occur naturally in some animals and can reverse-transcribe RNA into DNA and insert into the genome of host cells. In gene therapy, scientists take advantage of this feature to load therapeutic genes into retroviral vectors, allowing them to enter the patient's cells and express the required proteins to achieve therapeutic purposes.
