Abstracts

The reverse circulation drilling tool adopts the reverse circulation drilling method, which means that the flushing medium (such as mud, clean water or air) flows from the annular space between the drilling tool and the hole wall to the bottom of the hole, carries rock debris, and then returns to the surface through the inner hole of the drilling tool. This drilling method is opposite to the traditional positive circulation drilling method and has higher drilling efficiency and sampling accuracy.

The global Reverse Circulation Drilling Tool market size was estimated at USD 351.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
