## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Reversed Phase Silica Packing competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Reversed-phase silica packing is a chromatographic separation material based on high-purity porous silica, with its surface chemically modified with non-polar functional groups. The most common bonded phases are C18 (octadecyl), C8, C4, or phenyl. In reversed-phase HPLC (RP-HPLC), it utilizes hydrophobic interactions to achieve efficient separation of moderately polar to non-polar compounds. It is widely used in the analysis and purification of small molecule drugs, peptides, proteins, and natural products. This packing possesses a high specific surface area, excellent mechanical strength, and chemical stability, making it one of the most commonly used stationary phases in high-performance liquid chromatography (HPLC) and preparative chromatography. In 2024, the global production of reverse phase silica gel filler will reach 3,192 kg, with an average selling price of US\$27,778 per kg.

The global Reversed Phase Silica Packing market size was estimated at USD 88.69 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
