Abstracts

A reversible finishing mill is a specialized type of rolling mill used in metal processing, particularly in the steel and non-ferrous metal industries, to produce flat products such as plates, sheets, and strips with precise thickness, surface quality, and mechanical properties. It operates by passing the metal workpiece back and forth between two rolls, with each pass reducing the thickness incrementally; the "reversible" feature allows the same set of rolls to process the material in multiple directions without requiring reversal of the workpiece manually or through additional equipment. This design enhances efficiency, control, and uniformity in the final product, making it critical for high-precision applications in sectors like automotive, construction, shipbuilding, and heavy machinery manufacturing, where dimensional accuracy and material consistency are paramount.

The global Reversible Finishing Mill market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
