### Report Overview:

A Cavity Filter is type of RF filter that operates on the principle of resonance. Physically, it is a resonator with a “tuning screw” (to fine-tune the frequency) inside a “conducting box”. An RF or microwave resonator is a closed metallic structure (i.e., waveguides with both ends terminated in a short circuit). The resonator oscillates with higher amplitude at a specific set of frequencies, called resonant frequencies. When an RF signal passes through the cavity filter, a resonator acts as a band-pass filter and passes RF signals at particular frequencies (i.e., resonant frequencies) while blocking other nearby frequencies.

The Global RF Cavity Filters Market Size was estimated at USD 490.71 million in 2023 and is projected to reach USD 332.10 million by 2029, exhibiting a CAGR of -6.30% during the forecast period.
