Report Overview

RF feeder cables, also known as coaxial feeder cables, are specialized transmission lines designed to carry high-frequency radio signals between antennas and transmitters or receivers with minimal signal loss. These cables consist of an inner conductor surrounded by a dielectric insulator, a metallic shield, and an outer protective jacket, engineered to maintain signal integrity by minimizing electromagnetic interference (EMI) and attenuation. They are critical components in telecommunications, broadcasting, military communications, and wireless infrastructure, where reliable signal transmission is essential. The performance of RF feeder cables is measured by key parameters such as impedance (typically 50 or 75 ohms), frequency range, insertion loss, and shielding effectiveness, making them highly technical products tailored to specific applications. Their demand is closely tied to advancements in 5G networks, satellite communications, and IoT deployments, where higher frequencies and greater bandwidths necessitate superior cable performance.
