Report Overview

An RF signal is a high frequency AC waveform and can be measured with an AC current or voltage meter provided that the components are suitable for the frequency. A simple example would be a field strength meter using a voltmeter, and a detector diode to measure RF voltage, or a wire loop, also with a diode in series, to indicate the RF current in a conductor. Other commonly used measuring devices are SWR bridges which give an indication of forward and reverse power in RF circuits. And antenna analysers containing a variable RF oscillator. These can work as an SWR bridge and also indicate inductance, capacitance and impedance of an RF network. Spectrum analyzers and oscilloscopes give a visual depiction of wave-forms, frequency and phase variations.
