Report Overview

RF thin film probe card is a key interface device in the field of semiconductor testing. It is mainly used in wafer testing as a bridge between the tested chip and the tester. RF thin film probe card is mainly composed of printed circuit boards and probes. PCB (printed circuit board) is the main structure of the probe card, carrying core components such as probes and electronic components. The probe is a key component on the probe card, which is used to directly contact the pad or bump on the chip to derive the chip signal. The number and arrangement of the probes depend on the specific test requirements. During the wafer test process, the object to be tested (i.e. the chip on the wafer) is placed on the probe station. The tester directly contacts the pad or bump on the chip through the probe on the RF film probe card, and applies the chip signal generated by the tester to the device under test, and transmits the feedback signal in the device under test back to the tester. This process realizes the preliminary measurement of the electrical performance of the chip and screens out the bad chips for subsequent processing. RF film probe cards are widely used in the wafer testing process of technology products such as memory, logic, consumer, drive, and communication ICs. Preliminary testing of the electrical performance of the chip before chip packaging is an indispensable part of the semiconductor manufacturing process.
