Report Overview

RF waveguide attenuators are used to reduce the power level of a signal by a certain amount (gain), with little or no reflections. The output signal is reduced with respect to the input. Performance specifications for RF waveguide attenuators include operating frequency, EIA waveguide size, and VSWR. Operating frequency is the range of radio frequencies over which products meet all guaranteed specifications. The Electronic Industry Alliance (EIA) approves sizes for RF waveguide attenuation. Voltage standing wave ratio (VSWR), a unit-less ratio ranging from one to infinity, expresses the amount of reflected energy at the input or output of a device. A value of one indicates that all of the energy will pass through. Any other value indicates that a portion of the energy will be reflected.
