Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on RFCMOS Transceiver competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. RFCMOS Transceiver is a semiconductor device that integrates both radio frequency transmission and reception functions using CMOS technology, enabling cost-effective and high-performance wireless communication for applications such as automotive radar, industrial radar, and IoT devices. The production of RFCMOS Transceivers in 2024 was approximately 22.5 million units, with an average price of USD 12 per unit. The industry in 2024 operated at a capacity utilization rate of 51%, with an average gross margin of 55%. The upstream key raw materials for RFCMOS transceivers include silicon wafers, photoresist, photolithography machines, and etching machines, which are essential for producing high-quality RFCMOS transceivers. Representative suppliers include ASML (photolithography machines), Tokyo Electron (etching machines), and Applied Materials (photoresist), which provide the core equipment and materials needed for production. The midstream focuses on design and integration, involving system architecture, analog front-end, digital signal processing (DSP), mixed-signal verification, and wafer-level management. Innovations and improvements in integration during this phase determine the performance of RFCMOS transceivers. In the downstream, RFCMOS transceivers are widely used in automotive radar and industrial radar sectors. Notable companies like Valeo, Continental, and Aptiv utilize RFCMOS transceivers in their radar systems to enhance integration, reduce costs, and improve system performance. Currently, the RFCMOS transceiver market is primarily dominated by NXP Semiconductors and Texas Instruments. Ten years ago, automotive radar transceivers mainly used the SiGe approach. Although SiGe offered excellent RF performance, it could not integrate digital circuits (such as MCUs and

DSPs) into the same chip, requiring multiple independent chips for operation. Around 2017, TI was the first to launch a single-chip millimeter-wave radar based on RFCMOS technology, integrating the RF front end, ADC, DSP, and MCU into a single CMOS chip, significantly improving integration and reducing costs. Subsequently, NXP introduced its own high-integration RFCMOS solution by combining the RF front end with its powerful S32 processor architecture, effectively locking in numerous Tier 1 customers. Although Infineon had an advantage in the SiGe field, it failed to transition to RFCMOS technology in time, missing the market opportunity for high-integration radar.

The global RFCMOS Transceiver market size was estimated at USD 270.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.00% during the forecast period.
