## Abstracts

An RH Refining Furnace is a type of secondary steelmaking furnace used to refine molten steel, particularly for producing high-quality steel grades. It uses the RH (Recycling and Heating) process, which involves blowing gases such as argon or a mixture of argon and hydrogen into the molten steel through a lance submerged in the furnace. This helps remove impurities like sulfur, carbon, and oxygen, while also controlling the steel's temperature. The RH process is often employed to adjust the chemical composition and quality of steel before casting, making it essential for industries that require high-strength, low-alloy steels.

The global RH Refining Furnace market size was estimated at USD 85.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
