Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Rhodochrosite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Rhodochrosite is a manganese carbonate mineral (chemical formula $MnCO_3$) known for its pink to red coloration, often used both as an ore of manganese and as a decorative gemstone. Its supply chain begins with mining operations in countries such as Argentina, Peru, South Africa, and the USA (notably Colorado), where it occurs in hydrothermal veins and manganese-rich deposits. The raw mineral is extracted, sorted, and graded, with lower-grade ore primarily directed into the metallurgical supply chain for producing manganese used in steel alloys, batteries, and other industrial applications, while higher-quality crystals are cut and polished for use in jewelry and ornamental stones. Midstream processes include crushing, beneficiation, and sometimes chemical refining for manganese extraction, while downstream industries encompass steelmaking, battery manufacturing, chemical production, and the global gemstone trade. The global rhodochrosite industry sustains an annual production volume of around 1.9 million tons, encompassing both industrial-grade material used as a manganese source and gem/collector-grade specimens. Supported by an installed production capacity of approximately 2.5 million tons per year, the sector maintains an average gross margin of about 28%, with an average market price estimated at ~USD 515 per ton.

The global Rhodochrosite market size was estimated at USD 981.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
