Abstracts

Rhombohedral boron nitride (r-BN) is a metastable polymorph of boron nitride that shares structural similarities with graphite, featuring a layered, hexagonal arrangement of boron and nitrogen atoms but with a rhombohedral stacking sequence instead of the more common hexagonal one; often considered an intermediate phase between cubic boron nitride (c-BN) and hexagonal boron nitride (h-BN), it exhibits unique electronic and mechanical properties such as potential superconductivity under specific conditions, high thermal stability, and anisotropic behavior, making it a material of interest for specialized applications in electronics, lubrication, and high-pressure research where its distinct crystalline arrangement can be leveraged.

The global Rhombohedral Boron Nitride market size was estimated at USD 310.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
