Abstracts

Rigid impression materials are a class of dental materials used to create precise, dimensionally stable molds of oral structures, primarily for the fabrication of crowns, bridges, inlays, onlays, and dental prosthetics; these materials—which include polyethers, addition-cured silicones (polyvinyl siloxanes), and polysulfides—undergo a chemical setting reaction that results in a rigid, non-flexible final impression, offering high accuracy, minimal distortion, and excellent detail reproduction, making them indispensable in restorative and prosthetic dentistry where marginal fit and long-term functional outcomes are critical.

The global Rigid Impression Materials market size was estimated at USD 138.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
