Abstracts

Rigid PCB substrate resin refers to the thermosetting polymeric material used as the insulating base layer in rigid printed circuit boards, providing mechanical support, electrical insulation, and thermal stability for electronic components. These resins, typically epoxy-based, phenolic, polyimide, or cyanate ester formulations, are combined with reinforcing materials like glass fiber to form laminates such as FR-4, which dominate the market due to their balance of performance, cost, and manufacturability. The material's properties—including dielectric constant, thermal expansion coefficient, glass transition temperature (T_g), and flame retardancy—are critical determinants of PCB reliability and functionality across applications ranging from consumer electronics to aerospace and automotive systems.

The global Rigid Pcb Substrate Resin market size was estimated at USD 1520.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
