Abstracts

Rimmed Steel refers to steel that does not deoxidize well during steel making. In steelmaking, oxygen is used to remove excess carbon, and excess oxygen will form a variety of oxides into inclusions, which must be deoxidized. The deoxidation of boiling steel is only weakening the deoxidizer. For example, manganese ferrite can form manganese oxide and form iron oxide. However, when the iron oxide is poured into the steel ingot, carbon monoxide and iron are formed with the carbon in the steel. At this time, the carbon monoxide gas escapes from the steel ingot to make it boil, so it is called boiling steel.
