Abstracts

Ring force transducers, also known as load washers or ring-shaped load cells, are specialized force measurement devices designed as annular rings to measure compressive forces along their central axis. These sensors typically incorporate strain gauges bonded to the inner surface of the ring, which deform under applied load, generating an electrical signal proportional to the force. Their hollow, compact design allows them to be integrated into assemblies where force must be measured within confined spaces or around shafts, bolts, or other structural elements, making them ideal for applications in machinery testing, automotive engineering, aerospace component validation, and industrial automation where precise, non-intrusive force monitoring is critical.

The global Ring Force Transducers market size was estimated at USD 180.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
