Abstracts

Risk-Based Inspection (RBI) Service is a structured and data-driven approach to inspecting industrial equipment and infrastructure, where inspection priorities and frequencies are determined based on the likelihood and consequences of failure. Unlike traditional time-based inspection schedules, RBI focuses resources on the most critical assets by evaluating factors such as degradation mechanisms, operational conditions, material properties, and past inspection data. Using qualitative or quantitative risk assessment methodologies often aligned with international standards like API 580 and API 581, RBI helps identify high-risk components, predict potential failure modes, and optimize inspection intervals. The service typically includes risk ranking, inspection planning, corrosion loop identification, and the use of software tools or predictive models to support decision-making. By applying RBI, asset owners in industries such as oil and gas, petrochemicals, power generation, and manufacturing can enhance safety, ensure regulatory compliance, reduce inspection costs, and improve asset reliability.

The global Risk-based Inspection Service market size was estimated at USD 854.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.70% during the forecast period.
