Abstracts

RNA ligases are enzymes that catalyze the formation of phosphodiester bonds between two RNA molecules or within a single RNA strand, thereby joining or circularizing RNA fragments. They play a vital role in molecular biology experiments such as RNA repair, RNA interference, small RNA sequencing library construction, RNA labeling, and molecular probe preparation. Based on their source and function, RNA ligases can be divided into T4 RNA ligase 1 (which catalyzes single-stranded RNA or RNA-DNA ligation) and T4 RNA ligase 2 (which prefers to join double-stranded RNA ends). These enzymes typically rely on ATP as an energy source. These enzymes are widely used in fields such as high-throughput sequencing, noncoding RNA research, and synthetic biology.

The global RNA Ligase market size was estimated at USD 79.03 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
