Abstracts

Rna targeted small molecules represent a novel class of therapeutic agents designed to modulate RNA function by binding directly to specific RNA structures, such as secondary or tertiary motifs, to alter splicing, stability, translation, or other regulatory processes, thereby addressing diseases at the transcriptional or post-transcriptional level without targeting proteins directly. The global market for these molecules is rapidly evolving, driven by advances in RNA biology, computational modeling, and high-throughput screening technologies that enable the identification of druggable RNA targets previously considered undruggable. Key therapeutic areas of focus include rare genetic disorders, oncology, and neurological diseases, where traditional small-molecule or biologic approaches have shown limitations. Major pharmaceutical companies and biotech firms are increasingly investing in this space, with several candidates advancing through preclinical and early clinical trials, though the market still faces challenges such as optimizing selectivity, delivery, and pharmacokinetic properties specific to RNA engagement. Regulatory pathways are also being defined as the field matures, with the potential for accelerated approvals in areas of high unmet medical need. Competition is intensifying as both established players and startups explore diverse technological platforms, including structure-based design and phenotypic screening, to expand the repertoire of targetable RNAs and demonstrate clinical proof-of-concept.

The global Rna Targeted Small Molecules market size was estimated at USD 1260.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
