Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on RO Membrane Antiscalants competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Reverse osmosis membrane antiscalants are chemical additives specifically designed for reverse osmosis (RO) water treatment systems. Added to the influent, they effectively prevent the formation of insoluble salts such as calcium, magnesium, iron, barium, and strontium on the RO membrane surface. Their main components are typically organic phosphonates, polycarboxylic acids, or polymer dispersants. By chelating metal ions, inhibiting crystal nucleation and growth, and dispersing particulates, they extend membrane cleaning cycles and maintain system flux and salt rejection. They are widely used in seawater desalination, industrial pure water production, power plant boiler feed water, and wastewater reuse, and are key agents for ensuring the long-term, stable, and efficient operation of RO systems. In 2024, the global production of reverse osmosis membrane antiscalants will reach 384,160 tons, with an average selling price of US\$533.71 per ton. Reverse osmosis membrane antiscalants are a key technical tool for ensuring the efficient and stable operation of reverse osmosis systems. Their core value lies in effectively delaying or preventing the deposition of inorganic salt scale on the membrane surface through chemical intervention, thereby maintaining system flux, desalination rate, and operating cycle. With increasing water shortages and demand for wastewater reuse, antiscalants are developing towards high-efficiency, broad-spectrum, and environmentally friendly solutions. Compound products combine organic phosphonic acids with functional polymers to not only enhance their ability to inhibit calcium carbonate, calcium sulfate, and silica scale, but also disperse iron oxide and colloidal particles.

The global RO Membrane Antiscalants market size was estimated at USD 205.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
