Abstracts

Road User Charging (RUC) System is an intelligent transportation management and revenue-generation solution designed to charge vehicles for accessing or using specific road networks, infrastructure, or geographic areas, with the dual goals of optimizing traffic flow and funding transportation infrastructure maintenance or expansion. It leverages advanced technologies such as Global Positioning System (GPS), Electronic Toll Collection (ETC), Automatic Number Plate Recognition (ANPR), or in-vehicle telematics to track vehicle usage including distance traveled, time of travel, geographic zone, or vehicle type (e.g., passenger cars, commercial trucks, high-emission vehicles) and calculate fees based on predefined criteria (e.g., per kilometer, congestion-based pricing, low-emission zone access fees). Beyond revenue generation, the system aims to reduce traffic congestion, encourage the use of public transportation or low-carbon vehicles, and allocate road usage costs more equitably to users who impose the highest wear on infrastructure or contribute most to congestion.

The global Road User Charging (RUC) System market size was estimated at USD 2041.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
