## Abstracts

A Robot Dispatch System (RDS) is intelligent software that manages and optimizes the movement and tasks of a fleet of robots, such as Autonomous Mobile Robots (AMRs), within an automated environment like a smart warehouse or factory. It acts as a central command, handling task scheduling, traffic control, and robot coordination to ensure efficient and safe material handling. Traditional scheduling rules are being replaced by AI algorithms. Systems can not only respond passively but also proactively predict, make decisions, and optimize. Early systems typically could only schedule robots from a single brand. Now, systems like ADS from Bangqi Technology and E'tricc from Linde emphasize the ability to schedule multi-brand, multi-type robots, allowing robots from different backgrounds to work collaboratively on the same map, greatly improving the flexibility of enterprise deployment. With the rise of RaaS (Robotics as a Service), the high upfront cost of purchasing robots and systems is prohibitive for many enterprises, especially SMEs. RaaS allows businesses to pay based on usage or results, like subscribing to software, without the need to purchase hardware, significantly lowering the barrier to entry and reducing trial-and-error costs. From "unmanned" to "intelligent": the value of scheduling systems is no longer limited to replacing manual labor. In summary, robot scheduling systems have evolved from solving the fundamental problem of "how to prevent multiple machines from colliding" to becoming the AI hub driving the entire intelligent logistics and unmanned factory. Future development will focus more on the real-time performance and forward-looking nature of algorithms, the full openness of the ecosystem, and the flexible adaptation of business models, helping more enterprises achieve intelligent upgrades.

The global Robot Dispatch System market size was estimated at USD 1466.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.40% during the forecast period.
