Report Overview

Sensors are simple, straightforward devices that, in essence, serve as various human senses within automated equipment. They are used in assembly and end-of-line testing operations to detect the presence, position, orientation or movement of an object. After the sensor initially measures a physical quantity, an external signal conditioner converts the data into an electrical energy measurement so it can be read by a person or instrument.

Force sensors monitor the rate of change, and the relative change, in force between two surfaces. The sensors may be bolted or magnet-mounted within the assembly or testing equipment, or onto the part tooling.

Torque sensors measure and record the rotational force on various rotating systems. Some torque sensors only measure static torque, while others are able to handle static and dynamic (in process) torque. The sensors are installed between test pieces and their mounting plates, and either sit on a pedestal or “float” in the driveline.
